

A

The bipartite view

citing works on one side, the authors they cite on the other

CITING WORKS

CITED AUTHORS

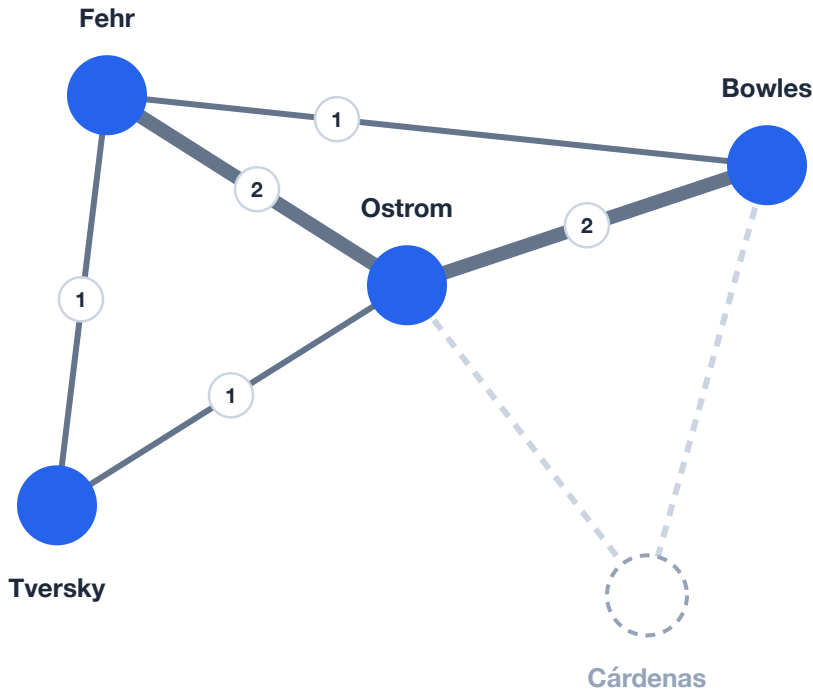

project

B

The one-mode projection

two authors are joined when one citing work names both; the weight counts how many do

1 One mention per citing work

B2 lists two Ostrom papers, but Ostrom counts once. The tie is between authors, not between reference-list entries.

2 No self-loops

An author is never joined to themselves, however many of their works a single bibliography happens to cite.

3 min\_papers prunes the tail

Cárdenas is named by one bibliography only, so min\_papers = 2 drops the node before the network is returned.
